

Learning Unlimited are a child care center who approached **Pro Computer Services** to review their computer requirements. They had one aging computer which was used both to carry out administration work for staff and to run educational software for the children.

Learning Unlimited required the ability to:

- Carry out administrative tasks
- Perform record keeping
- Provide children with access to educational software

Pro Computer Services setup a new computer with appropriate application software and provided templates to allow repetitive tasks to be simplified. Existing data was extracted from the old computer and installed on the new system. Anti spyware and internet security software was added and a data backup solution put in place.

The older computer was revitalised by removing all unnecessary software and files. Registry and hard drives were optimised allowing the computer to be put back into service as a system for running educational software.

Due to on going growth a wireless network was added, this allowed for sharing of printers and internet connection and allows for growth into adjacent building without installing wires for a network. With this network file / internet / and printer sharing and backup occurs between computers.
